Box Model

Q:> why do we need box model??

→ helps in calc. of dimensions & spacing of html elements

@AadishMandal on Telegram

→ Box model treats every html element as a rectangular box.

@AadishMandal on Telegram

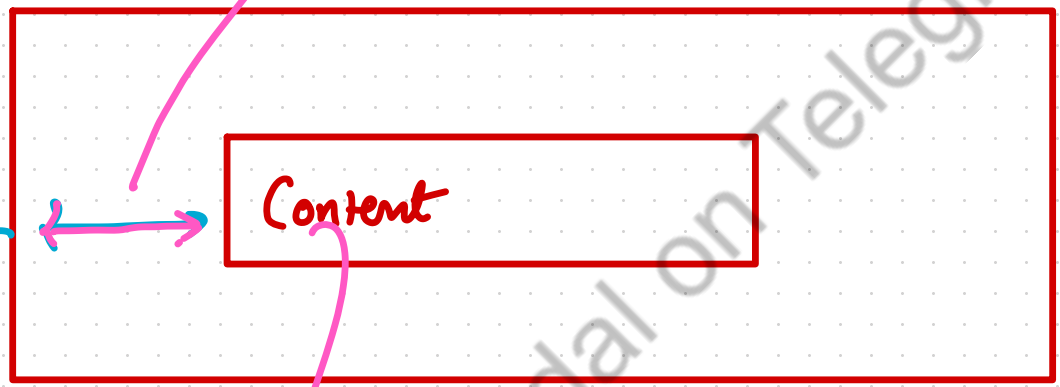
1) Content
2) Padding
3) Border
4) Margin

@AadishMandal on Telegram

a line surround our content

padding → transparent space btw border & content



margin → space outside the border

border

Content is the actual text or data to be displayed

@AadishMandal on Telegram

border : 1 px solid red ;

CSS property

width of the border

Style of border

color of the border

@AadishMandal on Telegram

width : 20 px ;

↓

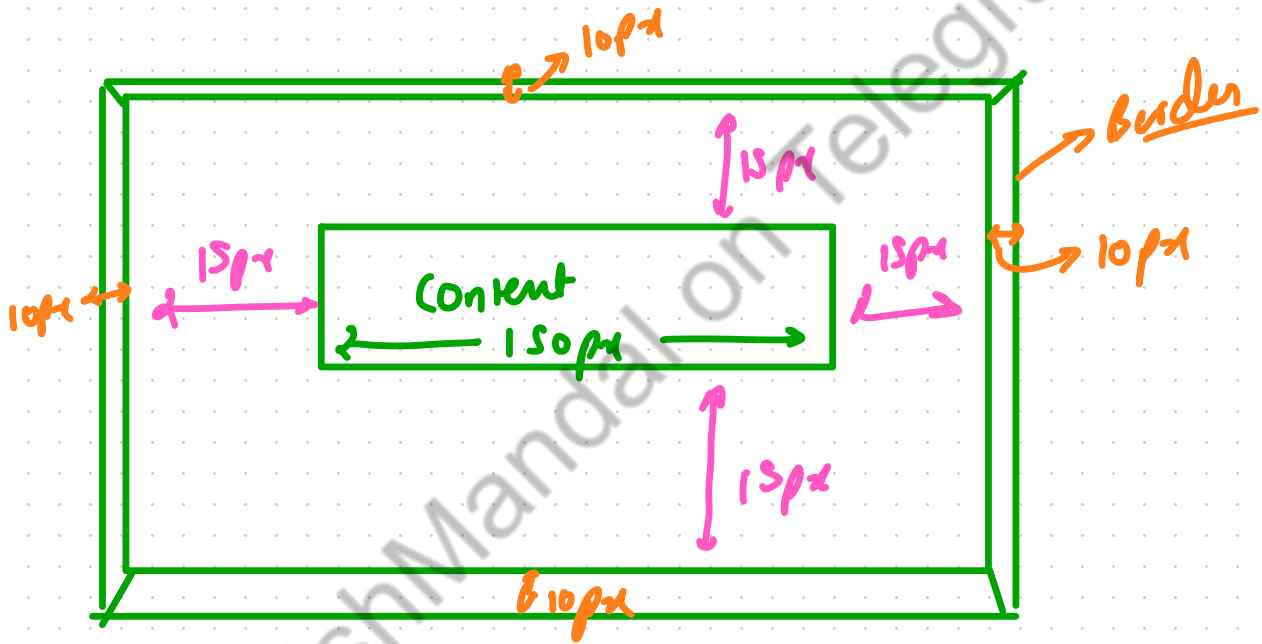
CSS property

using this we can allocate width to an element.

↓

By default when we give width to an element, it is applied only to the content

@AadishMandal on Telegram



width of the div ? → 150 + (2×15px) + (2×10px)

→ 200px

@AadishMandal on Telegram

U can calc width in one of the 2 ways

box-sizing
CSS-property

default

Content-box

width is allocated only to content & padding, border is beyond that.

Border Box

width is including the content + border + padding.

@AadishMandal on Telegram

content-box
